

Connecting your home

Connecting your home to the pressure sewer takes less than a day. The plumbing team will install four components on your property to complete connection:

- 1 A *OneBox*, our purpose built control unit to power the pump and tank unit and allow remote monitoring and control of the system.
- 2 An *inground tank and electric pump unit*, with only the lid visible, to allow servicing.
- 3 The *boundary kit*, contained in a small pit, includes a non-return valve to prevent sewage back up and allowing maintenance access.
- 4 A *property service line*, connecting the boundary kit to the tank and pump unit and discharging sewage off the property.
